AB - J04363309 Photocurable resin compsns. comprising (1) cpds. contg.
 radical polymerisable unsatd. gps., (2) metal allene cpds. and (3)
 organic pigments, and also (4) aromatic iodonium cpds..

- Cpd. (1) includes N-vinyl-2, -pyrrolidone, bisphenol-A di
 (meth)acrylate, tripropylene glycol di(meth)acrylate or pentaerythritol
 tri(meth)acrylate. Pref. (2) includes cpd. of the formula (I). Cpd.
 (3) includes coumarin dyestuff, merocyanine dyestuff, thiazine
 dyestuff, cyanine dyestuff, azo dyestuff, quinoline dyestuff,
 anthra-quinone dyestuff or stilbene dyestuff. (4) includes cpds. of
 the formula (II).

- USE/ADVANTAGE - For photoresists or image forming materials. Compsn.
 is cured by irradiating visual rays at higher sensitivities.

- In an example: 10 g of a mixt. consisted of polyethyleneglycol
 diacrylate and pentaerythritol heaxacrylate (3:4, 1.5 g of metal
 allene cpd. of the formula (III), 0.5 g of methylene blue and 0.5 g of
 diphenyliodonium bromide are mixed well by applying ultrasonic wave at
 100 deg.C to give the photocurable resin compsns.. Compsn. is coated
 on a polyester film (thickness = 50 micron) with a bar coater and is
 irradiated (670 nm). Coated layer is cured at 1460.06 erg/cm². "X =
 gps. contg. benzene ring.; Y = anions e.g. BF₄⁻, PF₆⁻, AsF₆⁻, SbF₆⁻; M
 = metal e.g. Fe, Ni, Co; Y1 = monovalent anions e.g. halogen, OH⁻,
 HSO₄⁻, BF₄⁻, PF₆⁻, AsF₆⁻".
